

AIRSORB PLUS

DESICCANT DRYING TABLET FOR COMPRESSED AIR

Air drying for Industrial desiccant in compressed air streams can be costly and difficult. Effective air drying through a deliquescent bed relies on inlet conditions including, but not limited to, temperature, moisture content, and pressure through the desiccant bed.

AirSorb Plus was developed to meet the dew point requirements in air drying, while providing a stable, easily handled effluent. AirSorb Plus tablets offer superior drying characteristics, while providing an effective low-cost way to dry compressed air.
